ISO 1940 1
ISO 1940-1 was prepared by Technical Committee ISO/TC 108, Mechanical vibration and shock, Subcommittee SC 1, Balancing, including balancing machines. This second edition cancels and replaces the first edition (ISO 1940-1:1986), which has been technically revised.

INTERNATIONAL STANDARD 1940-1
Abstract ISO 1940-1:2003 gives specifications for rotors in a constant (rigid) state. It specifies balance tolerances, the necessary number of correction planes, and methods for verifying the residual unbalance.

International Standard ISO 1940/1 is a widely- accepted reference for selecting rigid rotor balance quality. This paper is presented as a tutorial and user's reference of the standard and its practical applications. A simplified method is shown for determining permissible residual unbalance for various rotor classifications.

Balance Quality Requirements of Rigid Rotors
Balance Quality Grade ISO 1940/1 What is mean by G 0.4, G 1.0, G 2.5, G 6.3 and so on? G is the product of specific unbalance & the angular velocity of the rotor at maximum operating speed. What is specific unbalance? Specific unbalance - center of gravity displacement of rotor.

ISO 1940 is based on the measurement of machinery vibration velocity The ANSI spec is identical but printed by American National Standards Institute. The API specification is written around pump requirements in the Petro-Chemical Industries and classifies unbalance levels as a function of rotor mass and operating speed (Norfield, 2006).

Rotating Machinery Rotor Balancing - Lifetime Reliability
please explain the relationship between ISO balance grades and grades specified in API 610 (such as 4W/N,4W/N etc W - mass of rotor, N- RPM). In API 610 it mentioned as a note that 4W/N is equivalent to ISO 1940 Gr 1.0. Also that the grades mentioned in API are mid values of the range of the equivalent ISO grade.
