ECE6451-1. The Maxwell-Boltzmann Distribution Brennan 5.4. Lecture prepared by Melanie Hill.

ECE6451-2. Maxwell-Boltzmann Distribution. Scottish physicist James Clerk Maxwell developed his kinetic theory of gases in 1859. Maxwell determined the distribution of velocities among the molecules of a gas. Maxwell's finding was later generalized in 1871 by a German physicist, Ludwig Boltzmann, to express the distribution of energies among the molecules.

The Maxwell-Boltzmann distribution applies fundamentally to particle velocities in three dimensions, but turns out to depend only on the speed (the magnitude of the velocity) of the particles. A particle speed probability distribution indicates which speeds are more likely: a particle will have a speed selected randomly from the distribution, and is more likely to be within one range of speeds than another.

Maxwell-Boltzmann distribution - Wikipedia

The Maxwell-Boltzmann equation, which forms the basis of the kinetic theory of gases, defines the distribution of speeds for a gas at a certain temperature. From this distribution function, the most probable speed, the average speed, and the root-mean-square speed can be derived.

The Maxwell-Boltzmann (MB) distribution for velocities in ideal gases is usually defined between zero and infinity. A double truncated MB distribution is here introduced and the probability density function, the distribution function, the average value, the r th moment about the origin, the root-mean-square speed and the variance are evaluated. Two applications are presented: (i) a numerical ...

Boltzmann's most important scientific contributions were in kinetic theory, including for motivating the Maxwell-Boltzmann distribution as a description of molecular speeds in a gas. Maxwell-Boltzmann statistics and the Boltzmann distribution remain central in the foundations of classical statistical mechanics.

For ideal gases, the distribution function $f(v)$ of the speeds has already been explained in detail in the article Maxwell-Boltzmann distribution. The figure below shows the distribution function for different temperatures. $f(v) = (\sqrt{m/2\pi k_B T})^3 \cdot 4\pi v^2 \cdot \exp(-m \cdot v^2 / 2k_B \cdot T)$ Maxwell-Boltzmann distribution function.
